## **DETAILED ACTION**

### ***Response to Arguments***

1. Applicant's arguments, see page 4, filed 6/7/2005, with respect to the rejection(s) of claim(s) 2 under 35 U.S.C. 103(a) have been fully considered and are persuasive. Therefore, the rejection has been withdrawn.

### ***Allowable Subject Matter***

2. Claims 1-3 and 9 are allowed.

3. The indicated allowability of claim 5 is withdrawn in view of the newly discovered reference(s) to Erstad ("Erstad") USPN 6,307,237. Rejections based on the newly cited reference(s) follow.

### ***Claim Rejections - 35 USC § 102***

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

5. Claim 5 is rejected under 35 U.S.C. 102(e) as being anticipated by Erstad.

Erstad discloses in fig. 5 an insulated gate type semiconductor device comprised of a semiconductor layer 200 serving as an active region isolated from a semiconductor substrate by a substrate isolation insulating film (not shown), wherein a gate electrode 202/117 of an L-shape comprised of a trunk-shaped main gate electrode 204/116 extending in parallel with respect to said semiconductor substrate, and a crosspiece-shaped conductor pattern 206/118 extending in

parallel with respect to said semiconductor substrate and also extending toward the width direction of said main gate electrode being provided and, said trunk shaped main gate electrode being sandwiched between a source region 214 and a drain region 210, and at least part of said cross-piece-shaped conductor pattern being also sandwiched between said source region 214 and a drain region 210, and thereby at least part of said crosspiece-shaped conductor pattern functioning as an effective gate electrode.
